NOVELTY - A surface treated metal plate has an intermediate layer and corrosion-resistant coating layer of different composition. The intermediate layer contains IVA group oxide, hydroxide, oxyacid compound and/or oxyacid hydride. The corrosion-resistant coating layer contains oxyacid compound and/or oxyacid hydride of rare earth and/or IVA group element.

USE - As galvanized iron sheet, zinc group alloy plated steel plate, aluminum plated steel plate, cold rolled steel sheet used in motor vehicles, domestic electrical appliances, building materials.

ADVANTAGE - The surface treated metal plate has excellent anti-corrosion property and environmental compatibility, as the coating layer does not contain hexavalent chrome.

AB PROBLEM TO BE SOLVED: To produce a surface treated metallic sheet having a corrosion preventive coating layer which is excellent in corrosion resistance and does not contain hexavalent chromium at all.

SOLUTION: This metallic sheet has an intermediate layer essentially consisting of the oxides, hydroxides oxyacid compds. and/or hydrogen oxyacid compds. of the group IVA elements (such as zirconium) and has a corrosion resistant coating layer essentially consisting of rare earths (such as lanthanum and cerium) and/or the oxacid compds. or hydrogen oxyacid compds. or the mixture thereof (where the compsn. of the intermediate layer and that of the corrosion resistant coating layer are not the same). This coating film can contain resins, rare earth compds. and organic corrosion inhibitors.
